HACKTOBERFEST 26

Hack Day

Build with open-source AI

24–25 OCT

PUNE

NST.ADYPU · NSTSDC

HACKTOBERFEST HACK DAY

Welcome. Let's build.

BEFORE

Counting contributions. It led to spam.

THIS YEAR

Build and learn with open-source AI.

YOUR TIME

12 hours from idea to real.

The format

1–4

members per team

12 hrs

4:30 PM to 4:30 AM

Food

Timings:
Dinner: 8-10pm

Two tracks: enter one or both

TRACK 1 · MAIN TRACK

Best Open-Source AI Project

TRACK 2 · PARTNERS CHALLENGE

Best Use of Gemma 4

ONE PROJECT, ONE TRACK ONLY

TRACK 1 · MAIN TRACK

Best Open-Source AI Project

An original project with open AI at its core.

Agent skill · open-weight model · model harness

Public GitHub repo with an open-source license

HACKTOBERFEST HACK DAY

TRACK 2 · PARTNERS CHALLENGE

Best Use of Gemma 4

A lightweight open model that reads text and images. Use it through the Gemini API.

- Multimodal experience
- Tool for learning, creativity or community
- Rapid prototype

Start from zero

1. No earlier code or prototype
2. New, empty GitHub repo
3. Repo link by 5:15 PM

More rules

1. Name models, tools and licenses in your README
2. Main Track: public repo, open-source license
3. Use AI tools, but explain what you built. Or out.

Timeline

24 OCT

4:30 PM
Hackathon starts

5:15 PM
Repo link closes

9:30 PM
Mid-evaluation.

25 OCT

4:30 AM
Hackathon ends

4–8 AM
Break. Sleep in Room

8:00 AM
Final evaluation · 1:30 PM Prizes

HACKTOBERFEST HACK DAY

ROUND 1 · 9:30 PM

Mid-evaluation

01	02	03	04
Idea and scope	Progress	Understanding	Teamwork

Tip: have something working. Everyone can explain it.

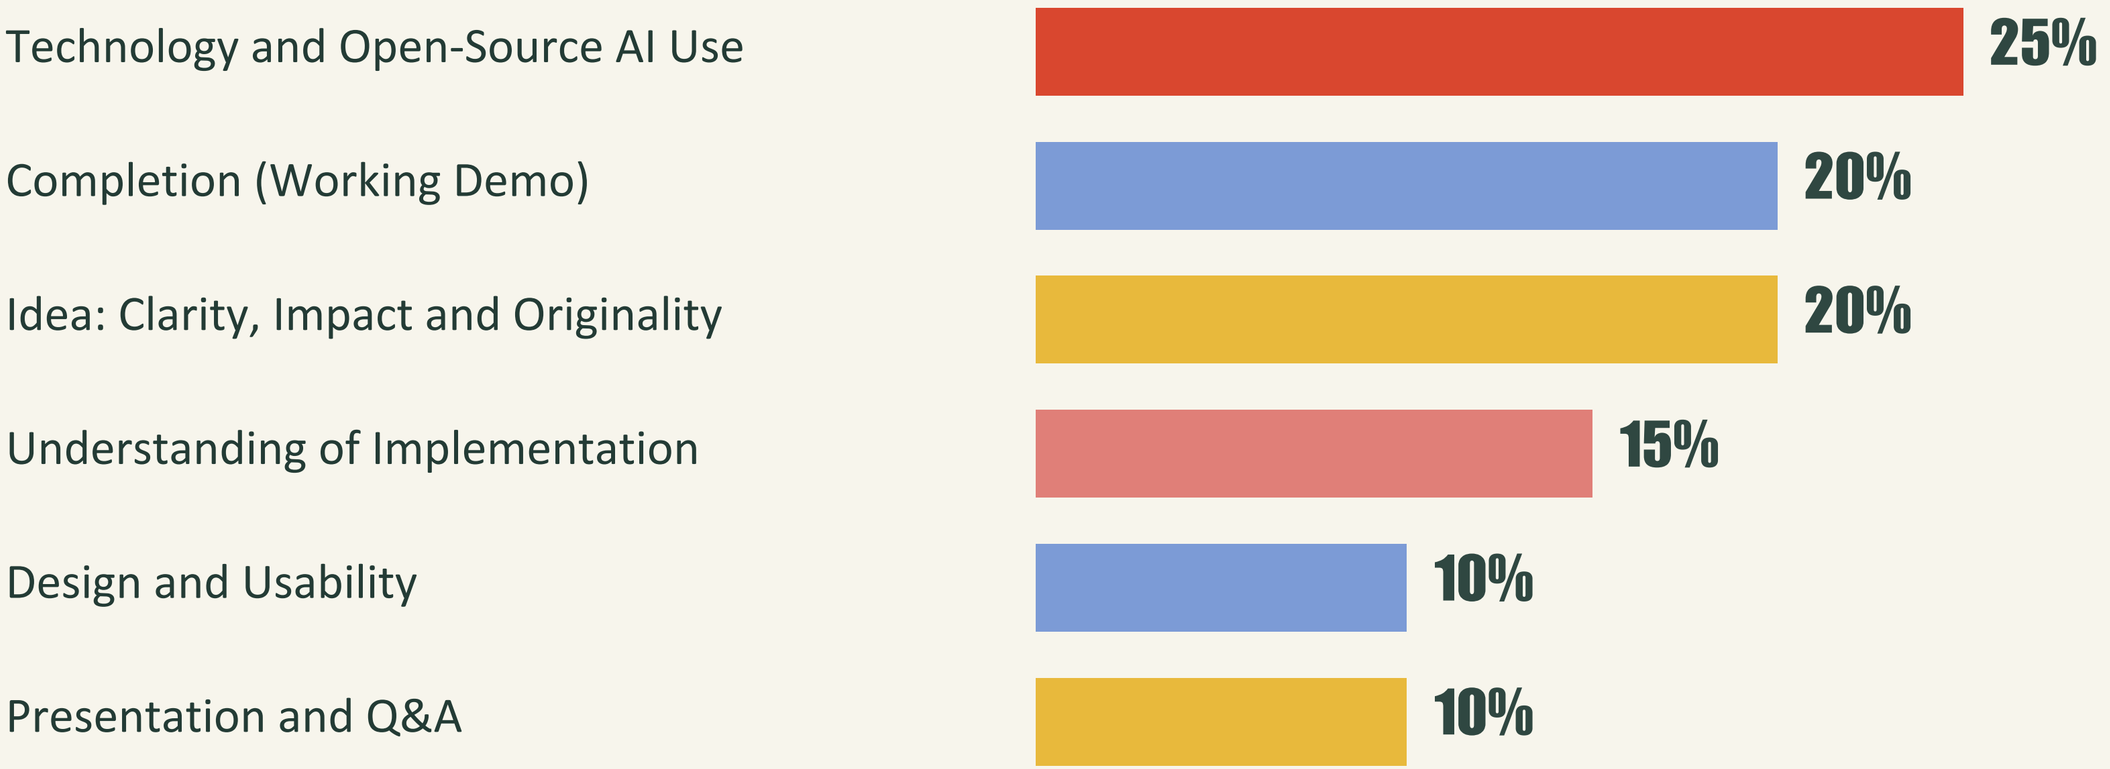

ROUND 2 · 8:00 AM

Final evaluation

8 min	4 min	4 min
per team	pitch	Q&A

Show: live demo · how it works · models and why · what you learned. **Judges can ask any team member.**

Final scoring

Submit on OrganizerHQ

1

Sign in, open your event

2

Challenges, then Add Submission

3

Enter repo, name, description, tech

4

Choose challenge, Submit Project

One submit, whole team

DEADLINE: [4:30am]

Add teammates after:
Your Submission, Add Member

Main Track prizes

1st Prize

Rs 12,000

2nd Prize

Rs 8,000

3rd Prize

Rs 5,000

PLUS MLH SWAG AND STICKERS

Gemma 4 Track prize

1

winning team

YOU TAKE HOME

Gemma swag kit, T-shirts and MLH swag

Problem Statements

Problem Statement #1

Title: Bolo: Voice Help for Everyday Government Services

Problem Statement: People who can't type or read long forms, often with poor internet, can't easily get reliable answers about public services and depend on middlemen.

Who it helps:

Rural and semi-urban users, village help-desk volunteers

What to build:

Help people who can't easily type or read long forms get reliable answers about public services by speaking in their own language, and point them to the official helpline when there is no answer.

Problem Statement #2

Title: Handwritten Answer-Sheet Grader

Problem Statement: Teachers in small schools and tuition centers grade many handwritten answers by hand.

Who it helps:

Teachers

What to build:

Help teachers grade handwritten answers faster and fairly against their own marking scheme, with feedback they can review and edit.

Problem Statement #3

Title: PII redaction for Indian documents and languages

Problem Statement: People paste documents with names, IDs and account numbers into cloud chatbots.

Who it helps:

Anyone using cloud AI with private documents

What to build:

Help people use online chat tools with private documents without exposing names, IDs or account numbers.

Problem Statement #4

Title: Smart Meeting Assistant

Problem Statement: After meetings, teams forget what was decided and who owns what. Most AI note-takers are paid, closed tools that send recordings to someone else's servers.

Who it helps:

Teams and student groups

What to build:

Help teams remember what was decided in a meeting and who owns each next step, without sending their recordings to a closed outside service.

Problem Statement #5

Title: Pesticide Label Reader for Indian Farmers

Problem Statement: Pesticide labels are dense and often hard to read in English or mixed languages, and misuse causes illness, crop damage and wasted money.

Who it helps:

Small and low-literacy farmers, farm workers, agri-input shop staff

What to build:

Help farmers understand a pesticide label, including the right dose for their tank, the waiting period and the safety steps, in their own language.

Problem Statement #6

Title: Legal Rights Awareness Assistant

Problem Statement: Most people don't know their basic legal rights, legal text is long and hard to read, and asking a lawyer even a simple question costs money.

Who it helps:

Citizens, tenants, workers, small shop owners

What to build:

Help ordinary people understand their basic legal rights in simple language, in the language they speak, with answers they can trace back to a reliable source.

Problem Statement #7

Title: Policy and HR Helpdesk Bot for Government Offices

Problem Statement: Staff keep asking the same questions about leave, travel claims and service rules, and the answers sit in long circulars that nobody can find.

Who it helps:

Government and office employees, admin and HR teams

What to build:

Give office staff quick, reliable answers to everyday policy and HR questions, so they don't have to search long circulars or keep asking the same people.

Problem Statement #8

Title: Career Guidance Companion for School Students

Problem Statement: Students choose streams and careers because of peer pressure or marks, since school counsellors are few and career information is scattered.

Who it helps:

School students (grades 9 to 12), parents, teachers

What to build:

Help school students discover career options that fit their interests and strengths, and understand the next steps, with clear reasons for every suggestion.

Problem Statement #9

Title: Private Wellness Check-In for Hostel Students

Problem Statement: Students rarely approach counsellors until things get serious, and they don't want to share personal thoughts with cloud apps.

Who it helps:

Hostel and college students, campus counsellors

What to build:

Give students a private, safe space to check in on how they feel each day, notice patterns over time, and reach a counsellor or helpline quickly when they need one. It supports professional help and never replaces it.

Problem Statement #10

Title: Look-Alike Website Detector

Problem Statement: Fake websites copy the look of banks and government portals, and people notice the wrong web address only after it is too late.

Who it helps:

Everyday internet users, small businesses, bank customers

What to build:

Help people tell whether a website is genuine or a fake copy, and explain the warning signs in plain words.

Problem Statement #11

Title: Sign-to-Speech Translator for Indian Sign Language

Problem Statement: People who use sign language struggle to communicate with those who don't, at hospitals, banks and offices.

Who it helps:

Deaf and hard-of-hearing people, shop and service staff

What to build:

Help sign-language users and people who don't know sign language communicate, by turning signs into text and speech that anyone can understand.

Problem Statement #12

Title: Network Anomaly Spotter

Problem Statement: Attackers often get into a network without triggering known warning signs, so teams notice only after the damage is done.

Who it helps:

Small IT teams, college and small-office network admins

What to build:

Help small IT teams notice early that something is wrong on their network, even when the attack doesn't match any known warning sign, and understand what to check first.

Problem Statement #13

Title: Floor Plan to 3D Viewer

Problem Statement: A flat 2D floor plan is hard for most people to picture, and building a 3D model by hand takes hours.

Who it helps:

Architecture students, builders, home buyers

What to build:

Help people picture a building by turning a flat floor plan into a 3D view they can explore.

Problem Statement #14

Title: Scheme Eligibility Navigator

Problem Statement: Citizens miss benefits because scheme rules are scattered across long PDFs in formal English or Hindi.

Who it helps:

Citizens, village help-desk volunteers

What to build:

Help citizens find out which government schemes they qualify for, why, and which documents to carry, in their own language.

Problem Statement #15

Title: Civic Complaint Triage and Routing

Problem Statement: Municipal portals receive thousands of free-text complaints (potholes, garbage, water leaks) that are sorted by hand.

Who it helps:

Municipal staff, ward officers, residents

What to build:

Help municipal teams sort, prioritize and route incoming complaints quickly, and spot repeated complaints about the same issue.

Problem Statement #16

Title: Mandi Price and Selling Assistant

Problem Statement: Farmers sell at the nearest mandi without knowing prices elsewhere.

Who it helps:

Farmers, farmer groups, traders

What to build:

Help farmers decide where and when to sell their produce for the best return, with the numbers behind the advice.

Problem Statement #17

Title: Local, Private Pull Request Reviewer

Problem Statement: Teams can't send proprietary code to cloud AI services, so they miss out on automated code review.

Who it helps:

Developers, student project teams, small companies

What to build:

Help teams get useful, trustworthy review of their code changes without sharing their code with outside services.

Problem Statement #18

Title: Docs Drift Detector

Problem Statement: READMEs and API docs go stale as code changes, so new contributors follow wrong instructions.

Who it helps:

Open-source maintainers, new contributors

What to build:

Help maintainers spot where docs no longer match the code, and suggest updates they can review before merging.

Problem Statement #19

Title: Dependency Upgrade and Migration Assistant

Problem Statement: Projects stay on outdated or vulnerable library versions because upgrades break things.

Who it helps:

Developers, maintainers

What to build:

Help developers upgrade dependencies safely by showing what will break, why, and the code changes needed to fix it.

Problem Statement #20

Title: Open-Source Contribution Finder

Problem Statement: Beginners want to contribute to open source but don't know where to start, and searching issues by hand is slow. Many issues are too hard, out of date or already taken.

Who it helps:

Students and first-time contributors

What to build:

Help beginners find open-source issues that match their skills and are actually open and ready to work on, and understand why each one fits.
